On Device NP = nasal prongs, HM = Hudson mask, HNP = humidified nasal prongs, HFNP = high flow nasal prongs

Assessme	ent of Respirato	ry Distress	
	Mild	Moderate	Severe
Airway	Stridor on exertion/crying	Some stridor at rest	Stridor at rest
Behaviour and feeding	Normal Talks in sentences	Some/intermittent irritability Difficultly talking/crying Difficultly feeding or eating	Increased irritability and/or lethargy Looks exhausted Unable to talk or cry Unable to feed or eat
Respiratory rate	Mildly increased	Respiratory rate in orange zone	Respiratory rate in purple zone Increased or markedly reduced respiratory rate as the child tires
Accessory muscle use	Mild intercostal and suprasternal recession	Moderate intercostal and suprasternal recession Nasal flaring	Marked intercostal, suprasternal and sternal recession
Oxygen	No oxygen requirement	Mild hypoxemia corrected by oxygen Increasing oxygen requirement	Hypoxemia may not be corrected by oxygen
Other		May have brief apnoeas	Gasping, grunting Extreme pallor, cyanosis Increasingly frequent or prolonged apnoeas

Refer to your local procedure for instructions on **how** to call for assistance and escalate care

MANDATORY EMERGENCY CALL

Choose MET or other Code response

Response criteria

- Apnoea or cyanosis
- Cardiac or respiratory arrest
- Airway threat
- Prolonged convulsion
- Sudden decrease in conscious state
- Any observation in the purple zone
- 3 or more simultaneous orange zone criteria
- Staff member is very worried about the child's clinical state
- · A family member is very worried about the child's clinical state

Actions required

- 1. Place emergency call
- 2. Initiate appropriate clinical care until the arrival of the emergency response team
- 3. Emergency response team to attend immediately, stabilise patient and/or provide advice
- 4. Emergency response team to document management plan

CLINICAL REVIEW RECOMMENDED

Response criteria

Victorian Children's

Tool for Observation and

Response

(1-4)

years) VP014

- Any observation in the orange zone
- Staff member is worried about the child's clinical state
- A family member is worried about the child's clinical state

Actions required

- 1. Initiate appropriate clinical care
- 2. Consider what is usual for the child and if the trend in observations suggests deterioration
- 3. Consult with nurse in charge, decide if a medical review is required

4. Medical review

- Increase frequency of observations as indicated by the child's condition
- If not attended within 30 minutes, escalate to emergency call
- Medical officer to document management plan

4. No medical review

• Document rationale & plan of care in Events/Comments

General Instructions

You MUST record baseline observations, including blood pressure, on admission and thereafter:

- · At a frequency appropriate for the child's clinical state
- Whenever staff or family members are worried about the child's clinical state
- If the child is deteriorating

Level of Consciousness should be documented using the AVPU scale, except for children receiving sedation, where a Level of Sedation score should be recorded.

Select a Pain Assessment tool appropriate for the age, developmental level and clinical state of the child. Refer to the website and/or the RCH clinical practice quidelines for pain tools.

Show the Trend: Plot the Dot-Join the Line

This chart is specifically designed to enhance the identification of trends in vital signs. It is important to look for worsening trends and report these.

When graphing observations, place a dot in the box and connect it to the previous dot with a straight line. For blood pressure use the symbols indicated on the chart. For SpO₂ write the number in the appropriate section.

Whenever an observation falls within an orange zone or purple zone, you MUST initiate the actions required for that colour. unless a modification has been made.

Modifications — refer to local procedure for altering calling criteria.

Level of Sedation (UMSS – University of Michigan Scoring System)

ONLY complete if sedation administered

- 0 = Awake and alert
- 1 = Minimally sedated: may appear tired/sleepy, responds to verbal conversation and/or sound
- 2 = Moderately sedated: somnolent/sleeping, easily roused with tactile stimulation or simple verbal command
- 3 = Deep sedation: deep sleep, rousable only with deep or physical stimulation
- 4 = Unrousable
